memory limit per test: 256 megabytes
input: standard input
output: standard output
points: 100 · problem code: lights1 · author: glipR

You stand before an infinitely long corridor containing lights and their respective switches. You'd like to turn a subset of the lights on using little robots that will flick certain switches infinitely along the corridor.

In this first problem, you'll be sending an infinite number of robots. The i^{th} robot will flick switches according to the following rule:

Robot i flicks light switch j if i divides j . In other words, the i^{th} robot flicks every i^{th} switch.

A light switch stays on if after all robots are done, it has been flicked an odd number of times. For example, Light Switch #4 is on because it was flicked by Robots 1, 2 and 4. While Light Switch #5 is off because it was flicked by Robots 1 and 5.

Input

Input will contain a single integer n , representing how many lights we'll be considering

Output

Output will contain a single integer, representing the total number of lights at position at or before the n^{th} light that are on at the end of execution

Constraints

- $1 \leq n \leq 10^{18}$

Examples

Input

3

Output

1

Explanation

1 is the only light switch turned on

Input

4

Output

2

Explanation

1 and 4 are the only light switches turned on
